Code Club 4 | Typescript

Overview:

Using Typescript, create a simple, functional calculator.

Stage 1:

Your calculator should allow users to perform addition, subtraction, multiplication and division operations. Your calculator should be accessed via the command line.

eg.

```
console.log("1 + 2 =", calculator.add(1, 2));
```

Stage 2:

Create a basic interface for your calculator so your calculator can be accessed via buttons.
